EMERALD

Technical Test
Backend Developer

Main instructions:

- Email us the repository link with your solution.
    - [Github](#) and [Bitbucket](#) are free to use.
    - Please do various commit so we can check your development and thought process during your test.
- Attach all the instructions needed to install dependencies, build or run the code. For example:
    ```
    $ npm i && npm start
    ```
- This test can be done in 1 day, but you have 7 days to complete it and send the link to your repository.

Task:

Build a **simple and clean** Node express API endpoints.

We currently have this API endpoint for our search results, but it returns too many information not needed/used in our [properties results page](#)

API endpoint:
https://api.emerald-stay.fr/api/properties?country=1&adults=1&children=0&page=1

- **Simplify** our current API search endpoint to only return the attributes we use in the [results page](#).
- **Add another** possible **endpoint** with the information left out from the search call. (for example /amenities/{property_id}
- Use a react page to **display your search results** from the improved API. **No need to style it**, just display the API results).

Remember you are a Backend Developer. This is a test to show off what you can do. Focus on what you want us to see about you.

You can always add more functionality (tests, lint, more endpoints) **but is not needed**.
